

Summary of the IberianBees database

The Iberian Bee Database contains **103464 entries** of bee occurrences over the peninsula and nearby islands. We have at least one record of **925 species** out of the **1055 species** known to occur in the Iberian Peninsula.

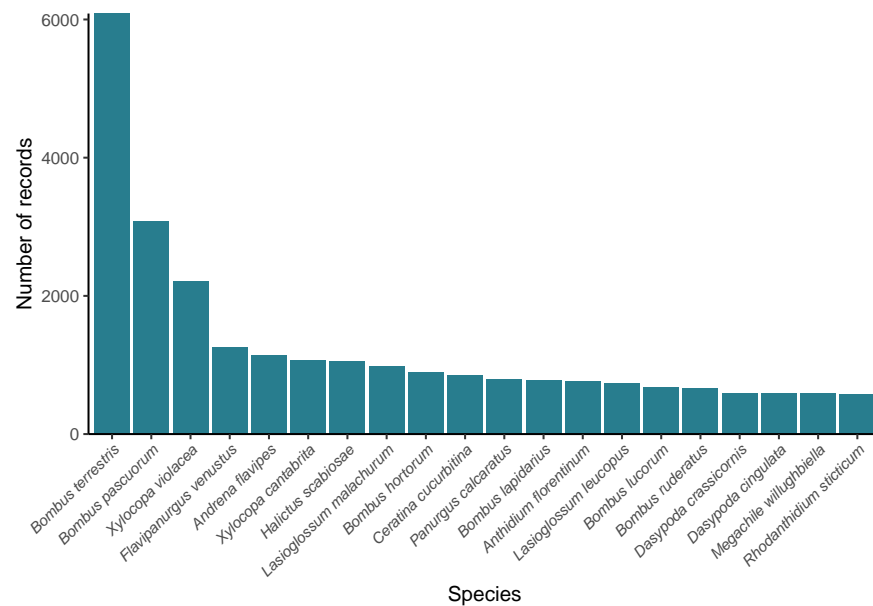

We retained only valid, updated species names. All records have accompanying metadata on where and when it was collected, and on who collected, identified and curated the data.

Here we present a summary of the database:

Where are the records? (Logarithmic scale of the number of occurrences)

Which are the 20 most reported species? (Excluding *Apis mellifera*)

When are we recording more bees?

Who make this possible?

This is a large collaborative effort lead by I. Bartomeus, L. Carvalheiro and T. Woods, but it would not be possible without the contribution of thousands of researchers. Full list of contributors will be available soon.

Contact nacho.bartomeus@gmail.com if you want to contribute.
